

## NGSS Lesson- Periodic Table Patterns

<b>Grade/ Grade Band:</b> 9-12	<b>Topic:</b> Periodic Table Patterns	<b>Lesson # 1 in a series of 1 lessons</b>
<b>Brief Lesson Description:</b> Students will use cards, representing elements to build a build of the periodic table.		
<b>Performance Expectation(s):</b> HS-PS1-1. Use the periodic table as a model to predict the relative properties of elements based on the patterns of electrons in the outermost energy level of atoms.		
<b>Specific Learning Outcomes:</b> Students will develop an understanding that the periodic table of the elements is organized based on the number of protons and similar properties.		
<b>Narrative / Background Information</b>		
<b>Prior Student Knowledge:</b> This lesson will follow the introduction/review of the basic parts of the atom including the nucleus and electron cloud as well as the locations and properties of Protons, Neutrons and Electrons.		
<p><b>Science &amp; Engineering Practices:</b> <i>Developing and Using Models</i> Modeling in 9–12 builds on K–8 and progresses to using, synthesizing, and developing models to predict and show relationships among variables between systems and their components in the natural and designed worlds.</p> <p>Use a model to predict the relationships between systems or between components of a system.</p>	<p><b>Disciplinary Core Ideas:</b> <i>PS1.A: Structure and Properties of Matter</i> Each atom has a charged substructure consisting of a nucleus, which is made of protons and neutrons, surrounded by electrons.</p> <p>The periodic table orders elements horizontally by the number of protons in the atom’s nucleus and places those with similar chemical properties in columns. The repeating patterns of this table reflect patterns of outer electron states.</p>	<p><b>Crosscutting Concepts:</b> <i>Patterns</i> Different patterns may be observed at each of the scales at which a system is studied and can provide evidence for causality in explanations of phenomena.</p>
<b>Possible Preconceptions/Misconceptions:</b> The periodic table is just a collection of element abbreviations.		
<b>LESSON PLAN – 5-E Model</b>		
<b>ENGAGE: Opening Activity – Access Prior Learning / Stimulate Interest / Generate Questions:</b> Show students examples of chemical reactions, ex. Sugar and sulfuric acid and Sodium and water. Students may be used to seeing water as something that puts out fire plus reacting with water is one of the characteristics in the Mendeleev’s Card game that they will complete next. This will give them an example of what reacting with water looks like. Water and sodium videos if real demonstration is not practical: <a href="https://www.youtube.com/watch?v=dmcfsEEogxs">https://www.youtube.com/watch?v=dmcfsEEogxs</a> and <a href="https://www.youtube.com/watch?v=HBYOeN155vo">https://www.youtube.com/watch?v=HBYOeN155vo</a>		
<b>EXPLORE: Lesson Description – Materials Needed / Probing or Clarifying Questions:</b> Student groups are given a deck of cards and will play a version Mendeleev’s Card Game where students will try to organize cards with element names and properties into logical groupings. The cards list many different properties for each element. (Card sheets at end of lesson.) Reference video example of a similar exercise: Mendeleev’s Game of Cards and the Birth of the Periodic Table: <a href="https://youtu.be/_yR3I8Lqx0o">https://youtu.be/_yR3I8Lqx0o</a>		
<b>EXPLAIN: Concepts Explained and Vocabulary Defined:</b> Short explanation of how the modern periodic table is organized. Compare with what students are finding in their arrangements.		
<b>Vocabulary:</b> Groups, metal, nonmetal, periodicity, noble gases, valence electrons, atomic mass		
<b>ELABORATE: Questions:</b> <b>Answer the following questions and be prepared to share with the class:</b>		
<ol style="list-style-type: none"> <li>1. What characteristics did you use for sorting the cards?</li> <li>2. What patterns appear in your arrangement?</li> <li>3. Where did you put H and He? What was your reasoning for their placement?</li> <li>4. Did you notice any cards that didn’t quite fit or seemed out of order? Explain</li> </ol>		
<b>EVALUATE:</b>		
<b>Formative Monitoring (Questioning / Discussion):</b> How did the students recognize the patterns and relationships between the cards? Have students do a walking tour of the room and see how other groups organized their element cards.		
<b>Elaborate Further / Reflect: Enrichment:</b> Give student groups a chance to change they way they have organized the cards based on what they have seen from other groups. Wrap up with a whip-around discussion where groups share what patterns they focused on in organizing their cards and explain what they changed, if anything, after seeing how other groups organized their cards.		
Watch this short video about Mendeleev’s life and who he organized the elements. It also discusses how the patterns he identified allowed him to predict the properties of yet undiscovered elements to a very high level of precision. ## **Dmitri Mendeleev's Card Game A Card Sort Activity**

### **Instructions:**

1. Working in your group with one set of cards.
2. Find Be, Mg, Ca, and Sr in the deck of cards, and arrange them in columns the way Mendeleev did. These cards are yellow. Look for similarities and differences in these cards. Find at least one pattern or trend and describe it to your group.
3. With your group, decide to organize the rest of the Cards into a table. Trying to organize them in a way that reduces as many patterns as possible.

### **Answer the following questions and be prepared to share with the class:**

1. What characteristics did you use for sorting the cards?
  
  
  
  
  
  
  
  
  
  
2. What patterns appear in your arrangement?
  
  
  
  
  
  
  
  
  
  
3. Where did you put H and He? What was your reasoning for their placement?
  
  
  
  
  
  
  
  
  
  
4. Did you notice any cards that didn't quite fit or seemed out of order? Explain.

<p><b>Calcium</b></p> <p>moderately hard, silvery solid metal</p> <p>40.1</p> <p>Ca</p> <p>reacts with water</p> <p>found in solid <math>\text{CaCl}_2</math></p>	<p><b>Phosphorus</b></p> <p>red solid nonmetal</p> <p>31.0</p> <p>P</p> <p>does not react with oxygen</p> <p>found in <math>\text{PH}_3</math> gas</p>	<p><b>Chlorine</b></p> <p>greenish yellow gas nonmetal</p> <p>35.5</p> <p>Cl</p> <p>reacts violently with metals</p> <p>found in HCl gas</p>	<p><b>Gallium</b></p> <p>silvery liquid metal</p> <p>69.7</p> <p>Ga</p> <p>does not react with oxygen</p> <p>found in solid <math>\text{GaCl}_3</math></p>	<p><b>Beryllium</b></p> <p>hard, dull gray solid metal</p> <p>9.0</p> <p>Be</p> <p>does not react with water</p> <p>found in solid <math>\text{BeCl}_2</math></p>
<p><b>Sodium</b></p> <p>soft, silvery solid metal</p> <p>23.0</p> <p>Na</p> <p>reacts vigorously with water</p> <p>found in solid NaCl</p>	<p><b>Iodine</b></p> <p>bluish black solid nonmetal</p> <p>126.9</p> <p>I</p> <p>reacts with metals</p> <p>found in HI gas</p>	<p><b>Krypton</b></p> <p>colorless, odorless gas nonmetal</p> <p>83.8</p> <p>Kr</p> <p>unreactive</p>	<p><b>Lithium</b></p> <p>silvery solid metal</p> <p>6.9</p> <p>Li</p> <p>reacts with water</p> <p>found in solid LiCl</p>	<p><b>Sodium</b></p> <p>soft, silvery solid metal</p> <p>23.0</p> <p>Na</p> <p>reacts vigorously with water</p> <p>found in solid NaCl</p>

<p><b>Selenium</b></p> <p>Gray solid nonmetal</p> <p>79.0</p>  <p>reacts slowly with metals</p> <p>found in H<sub>2</sub>Se gas</p>	<p><b>Nitrogen</b></p> <p>colorless, odorless gas nonmetal</p> <p>14.0</p>  <p>found in NH<sub>3</sub> gas</p> <p>not very reactive</p>	<p><b>Magnesium</b></p> <p>moderately hard, silvery solid metal</p> <p>24.3</p>  <p>found in solid MgCl<sub>2</sub></p> <p>reacts only slightly with water</p>
<p><b>Bromine</b></p> <p>reddish brown liquid nonmetal</p> <p>79.9</p>  <p>reacts vigorously with metals</p> <p>found in HBr gas</p>	<p><b>Oxygen</b></p> <p>colorless, odorless gas nonmetal</p> <p>16.0</p>  <p>found in H<sub>2</sub>O liquid</p> <p>reacts slowly with metals</p>	<p><b>Fluorine</b></p> <p>pale yellow gas nonmetal</p> <p>18.998</p>  <p>found in HF gas</p> <p>explodes upon contact with metals</p>
<p><b>Boron</b></p> <p>hard, black solid metalloid</p> <p>10.8</p>  <p>found in BCl<sub>3</sub> gas</p> <p>does not react with oxygen</p>	<p><b>Hydrogen</b></p> <p>colorless, odorless gas nonmetal</p> <p>1.0</p>  <p>found in HCl gas</p> <p>explodes in air when sparked</p>	<p><b>Arsenic</b></p> <p>brittle, steel gray solid metalloid</p> <p>74.9</p>  <p>found in AsH<sub>3</sub> gas</p> <p>reacts very slowly with oxygen</p>

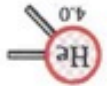

**Carbon**  
hard, clear solid (diamond) or soft, black solid (graphite) *metalloid*

found in  $\text{CH}_4$  gas

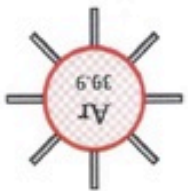

does not react with oxygen

**Helium**  
colorless, odorless gas *nonmetal*

unreactive

**Argon**  
colorless, odorless gas *nonmetal*

unreactive

**CREATE A TABLE**

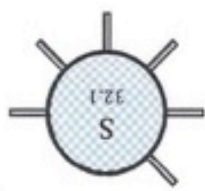

Card sort activity

1. Work in your group with one set of cards.
2. Find Be, Mg, Ca, and Sr in the deck of cards, and arrange them in a column the way Mendeleev did. These cards are all yellow. Look for similarities and differences in these cards. Find at least one pattern or trend, and describe it to your group.
3. With your group, decide how to organize the rest of the cards into a table. Try to organize them in a way that produces as many patterns as possible.

Be prepared to answer these questions:

1. What characteristics did you use for sorting the cards? What patterns appear in your arrangement?
2. Where did you put H and He? What was your reasoning for their placement?
3. Did you notice any cards that didn't quite fit or that seemed out of order? Explain.

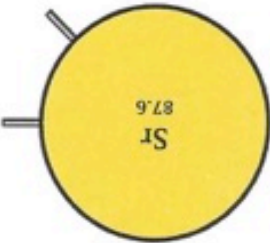

**Sulfur**  
brittle, yellow solid *nonmetal*

reacts slowly with metals

found in  $\text{H}_2\text{S}$  gas

**Strontium**  
moderately soft, silvery white solid *metal*

reacts vigorously with water

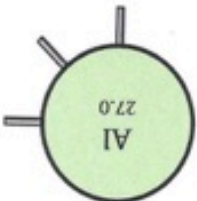

found in solid  $\text{SrCl}_2$

**Neon**  
colorless, odorless gas *nonmetal*

unreactive

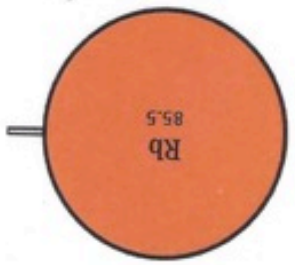

**Aluminum**  
soft, silvery solid *metal*

does not react with oxygen

found in solid  $\text{AlCl}_3$

**Rubidium**  
extremely soft, silvery solid *metal*

explodes upon contact with water

found in solid  $\text{RbCl}$

**Tin**  
 moderately soft,  
 silvery gray solid  
 metal

118.7  
 Sn

reacts very slowly  
 with oxygen  
 found in  
 $\text{SnH}_4$  gas

**Antimony**  
 very brittle,  
 bluish white  
 solid  
 metalloid

121.8  
 Sb

reacts very slowly  
 with oxygen  
 found in  
 $\text{SbH}_3$  gas

**Tellurium**  
 silvery gray solid  
 metalloid

127.6  
 Te

reacts slowly  
 with metals  
 found in  
 $\text{H}_2\text{Te}$  gas

**Potassium**  
 very soft,  
 silvery solid  
 metal

39.1  
 K

reacts violently  
 with water  
 found in  
 solid KCl

**Xenon**  
 colorless,  
 odorless gas  
 nonmetal

131.3  
 Xe

unreactive

**Indium**  
 very soft,  
 silvery solid  
 metal

114.8  
 In

reacts very slowly  
 with oxygen  
 found in  
 solid  $\text{InCl}_3$

**Silicon**  
 moderately hard,  
 silvery solid  
 metalloid

28.1  
 Si

reacts very slowly  
 with oxygen  
 found in  
 $\text{SiH}_4$  gas
